DTF – Direct to Fabric (commonly used)

- ✓ Ink coverage Better saturation with the same amount of ink (or even less)
- ✓ Materials DTF only requires one media (the transfer paper is not required)

Transfer – Using printed transfer paper (rarely used)

➤ Print through — Although the application can also be printed with this printing type, the recommendation is to use Direct Printing, because using transfer paper requires more dwell time during the calendaring process to achieve a similar level of print through, compared to direct printing.

Coated

There are **NO coated flags** because:

- The fabric would gain too much stiffness.
- A flag must be porous to wave with the wind.

Treated

All of these are treated to improve image quality when printing on them directly. The treatment is a dip coating that keeps the original touch and feel.

The manufacturer may or may not include a flame-retardant component at the same time as the previous treatment.

The use of an ink collector is mandatory to avoid staining the platen of the printer and damaging the vacuum system.

NOTE: Find the validated materials here: https://www.printos.com/ml/#/homeMediaLocator
The database is continuously being updated with more media.

The list of validated materials is dynamic. Several examples of good performers are:

Treated

- Aberdeen 5384 Mesh
- Aurich 3158FRM GeoMesh
- Aurich 350X FlagSuperb
- Berger G-Flag 117 FR
- Georg and Otto 6043
- Georg and Otto 6050 KGFS
- Georg and Otto 6144 GFS

NOTE: See the post-processing recommendations that can be found in this document to get the best results.

Normal mode for Direct to Fabric

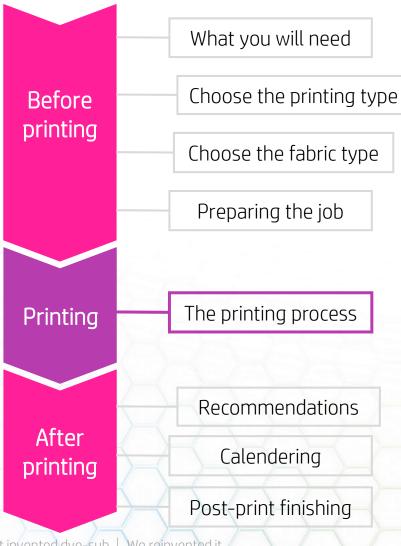

Mirror mode for Transfer printing

SAY HELLO TO HP STITCH

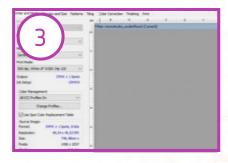

The printing process

- 1. Load the substrate on the printer as Direct to Fabric > Generic Bleed Through Textile in the case of Direct to Fabric, or Transfer Paper > Generic 70 to 110 gsm paper in the case of Transfer printing.
- **2.** Follow the loading process. As a recommendation, click the **Media Loading Accessory** checkbox.
- 3. Select the right media preset by using a Generic or a recommended profile from the front panel or the Media Locator webpage* (filtering by application and selecting Flags) then select the preferred print mode from the offered ones and send.
- **4.** Prepare the job, number of copies, size, nesting several images...

Recommendations after printing

What you will need Choose the printing type Before printing Choose the fabric type Preparing the job The printing process Printing Recommendations After Calendering printing Post-print finishing

Time from printing to the sublimation process

The sooner printed samples are sublimated the better, otherwise there is the risk of ink migration because the ink is not fixed yet.

Handling

In the case of direct printing, it's very important to handle printed rolls with care during transportation to the calender. Minimal pressure should be applied to the printed materials, so it is preferable to hold the rolls by the edges (inside the carton cores).

Ink collector

Depending on the porosity of the material, the ink collector foam will require replacement more often, but the recommendation is to change it every 100 meters. Ideally, to avoid staining the material during the loading/unloading process, the recommendation is to use 100m rolls and replace the foam with every new roll.

Calender settings

In order to get the best print through and to avoid damaging the polyester, the recommended range of temperature is 200-205°C and 50-60 seconds of dwell time.
